Fyi

"As part of the FLD decom and RHEL-7 server decom effort, we would like to replace the origins for existing prod SSO URLs "<https://www.verizon.com/isso> and <https://www22.verizon.com/isso> with 2 new origins in TDC/SDC data centers (www22-tdc-isso.verizon.com, www22-sac-isso.verizon.com) in **staging Akamai** first with geo affinity with both origins taking traffic in "active/active" mode and an automatic failover to other origin if one goes down (TDC failover to SAC, SAC failover to TDC) . Keep-alive location remains as "/isso/fpkeepalive.html. Please add "redirect_to" cookie feature so that we can test each data center separately. Please make this change in **staging Akamai** first. Once we test in staging Akamai, we will open CA to make the same change in prod Akamai. Both VIPs www22-tdc-isso.verizon.com and www22-sac-isso.verizon.com resolve in external DNS and reachable from the internet".
